

Nalcor Energy launches new Muskrat Falls website

May 17, 2013 – Today, Nalcor Energy launched a new Muskrat Falls Project website, **www.muskratfalls.nalcorenergy.com**. The website provides detailed information on construction activities, employment and business opportunities, as well as the latest project updates, reports, photos, videos and news.

The Muskrat Falls Project includes construction and operation of the 824 megawatt hydroelectric generating facility at Muskrat Falls in Labrador and more than 1,500km of associated transmission lines and terminal stations across the province. This energy development will provide significant long-term benefits to the province of Newfoundland and Labrador through the generation and transmission of clean, renewable energy. This new source of power will help meet the province's growing energy demands with stable electricity rates well into the future, and will be a valuable power-producing asset for more than 100 years.
